are present invention describes makely epilopes (1), also described are present invention describes makely epilopes (1); also described and binds to a complex of (1); (2) a peptide (TI) comprising (I) and a second epitope and has less than 50 contiguous amino acids; (3) a vaccine composition comprising (II), a unit dose of a peptide with at least 50 configuous amino acids with 100% identity to the nature peptide sequence of MAGE2/3, and a pharmaceutical excipient; (4) an isolated nucleic acid encoding (I); and (5) an isolated nucleic acid encoding (II). (1) has crytostatic activity, and can be used in vaccines and as an immunostimulant. A vaccine of (3) is useful for monitoring or evaluating and prevention of cancer. (I) is useful for monitoring or evaluating and prevention of cancer. (I) is useful for monitoring or evaluating and prevention of cancer. (I) is useful for monitoring or evaluating and patient with (I) that binds to a human leukocyte antigen (HLA) allele present in the patient and detecting the presence of the T-lymphocyte that binds to the peptide. The vaccine allows the opportunity to combine epitopes derived from multiple tumour associated molecules reducing the likelihood of frumour secape due to antigen loss. AAGM$15 to AAGM$4999 and AAB99725 represent amino acid sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human leukocyte antigen; HLA; major histocompatibility complex; MHC; yctocoxic T lymphocyte; CTL; human class I MFC; immunogenic; HLA binding peptide; fumune response; glycoprotein; cytostatic; virucide; hepatotropic; antiinflammatory; anti-HIV; vaccine; chamman immunodeficancy virus; protococide; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; human papilloma virus; HPV; cytomegalovirus; CMV; acquired immunodeficiency syndrome; AIDS; renal carcinoma; cervical carcinoma; lymphoma; malaria; cordiance accordiance acuminatum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
    present invention describes MAGE2/3 epitopes (I). Also described

  The patent discloses antigenic peptides derived from MAGE-A12

protein and presented by human leukocyte antigens (HLAS). These
antigenic peptides when presented by an antigen presenting cell
having a HLA class I molecule, effectively induce the activation
and proliferation of COBH eyrotoxic T lymphocytes. MAGE-A12 is
useful for treating a subject having a disorder characterised by
comprision of MAGE-A12. The protein microarray comprising MAGE-A12

is useful for diagnosing a disorder, especially cancer, by determining
the binding of an antibody. T lymphocytes or a HLA molecule isolated
compression of MAGE-A12. MAGE-A12 is useful for treating cancers.

CC from the subject suspected of having the disorder characterised by the
expression of MAGE-A12 is useful for treating cancers.

CC colrectal carcinomas, melanomas, oesophageal, lung, head and
complete and renal carcinomas and to produce antibodies. MAGE-A12

contibodies are useful for diagnosing disorders characterised by
contibodies are useful for diagnosing disorders characterised by
antibodies are useful for diagnosing disorders characterised by
controlled and vaccines. They are also used in gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                  AAW79124;
                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                              RESULT 5
                                                                                                                                                                                                                                                                  QQ
The present invention describes a composition (1) which comprises at least one human leukocyte antigen (HLA) binding peptide comprising an isolated, prepared epitope comprising one of 547 8-11 residue amino acid sequences (51), given in AAB75803 to AAB76349. (1) has cytostatic, virucide, hepatotropic, antinflammatory, anti-HV (human immunodefichency virus) and protozocatide activities, which can be used in vaccine production and is an inducer of cytotoxic T-cell response. (1) is useful for inducing a cytotoxic T cell response against a preselected antigen in a patient expressing a specific major preselected antigen in a patient expressing a specific major of relative complexibility complex (MHC) class I allele, by contacting cytotoxic T cells (CTLs) from the patient with (1). (1) is useful as a vaccine to treat and/or prevent viral infection and cancer such as prostate cancer. Cytomegalovirus (CMV), acquired immunodeficiency syndrome (AIDS), renal carcinoma, cervical carcinoma, lymphoma, malaria, and condyloma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to compositions containing immunogenic peptides, which composites a B7-like-supermotif. The compositions can be used, as vaccines, to treat or prevent viral diseases (hepatitis B or C. Epstein-Barr, human immune deficiency, Lassa fever or cytomegaloviruses), cancers (e.g. of prostate, kidney or cervix, or lymphoma, where associated with expression of p53, carcino-embryonal antigen or Her2/neu), or malaria. The peptides are also useful as diagnostic agents, e.g. to predict the outcome of a particular therapy and to identify subjects at risk of developing a chronic infection. Nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New immunogenic peptide with B7-like supermotif, useful in vaccines against e.g. viral infection and cancer, induces a cytotoxic T cell response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human major histocompatability complex; HLA; immunogen; cancer; viral infection; vaccine; antigen; anti-HIV; virucide; cytostatic;

Sequences shown in AAW79110 to AAW79125 are obtained by oligomerisation of a selected minimal moutif by complementary oligonuclectides. The invention provides a method for increasing the resistance of a core protein to proteolytic degradation that comprises linking or inserting conto or into the core protein a stabilising polypeptide of formula of formula (Glya)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(Glyb)X(
                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
encoding the peptides can be used in DNA vaccines. The present sequence is an immunogenic peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fusion protein; stabilising polypeptide; proteolytic degradation; resistance; half-life; autoimmune disease; inflammation; nitro drug; Ikappa regulator protein; inflammatory bowel disease; in vivo imaging; nitroreductase protein; enzyme therapy; prodrug therapy; protease; cancer; pathological condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New fusion proteins resistant to proteolytic degradation - comprising a core protein with a stabilising polypeptide comprising a peptide sequence containing glycine repeats
                                                                                                                                                                                                                                                                                                                                                                                                                                        0;

This invention relates to the preparation of angiotensin I converting enzyme (ACE) inhibitors by a microbiological process. The inhibitors are useful as hypotensive agents, and heat resistant ACE inhibitors are used in food processing. The invention includes examples of ACE I inhibitory peptides, represented by sequences AAB26858-B26868.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Angiotensin I converting enzyme; ACE; ACE inhibitor; hypotensive agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide production; fusion peptide; histidine tag; enterokinase; ACE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAM17687-W17698 represent synthetic substrates for proteases known to be crive in and/or immediately adjacent to certain specified cell or tissue abnormalities. This sequence is a substrate for cathespin D. These sequences can be used in the conjugate system of the invention.

These sequences can be used in the conjugate system of the invention. The conjugate system is for delivering a therapeutic or dapprostic agent to a tissue abnormality site (ThS) in a patient. The system comprises a lipophilic or amphiphilic agent, covalently linked to a protease a sensitive polypeptide (such as this sequence) having an amino acid sequence readily cleavable by a protease active at the TAS, but not at a compalities use is a solubility modifier conjugated to the protease sensitive polypeptide. Peptides sensitive to cleavage by bacterial collagenase. They IV (also known as 72 kd galatinase, mammalian matrix proteinase-1, or MMP-2), or mesoporphyrin IX, can also be used in the caused by malignancy, tissue allymies, intravascular or extravascular collagenase by malignancy, tissue injuries, intravascular or extravascular collagenase.

The invention relates to a method for determination of the amino acid sequence of an unknown peptide. The method comprises (a) determining the molecular mass and an experimental fragmentation spectrum for the molecular mass and theoretical fragmentation spectrum of the peptide; (b) comparing the experimental fragmentation spectrum for the unknown peptide with a theoretical fragmentation spectra calculated for a peptide intrary composed of all possible linear sequences of amino acids having a total mass that corresponds to the molecular mass of the unknown peptide; and (c) identifying a peptide in the library with a theoretical fragmentation spectrum that most closely matches the tragmentation spectrum of the unknown peptide. The method is useful in DNA cloning, anti-body production, identification of recombinant products, and the study of post-translational modifications. It allows the sequence of unknown peptides or proteins with no sub-sequence identity, to be characterised using mass spectrometry Sequences and the method. The isoleucine residue in these peptides can be replaced by leucine to construct another 264 linear peptides to be included in the library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method for determination of the amino acid asquence of an unknown peptide. The method comprises (a) determining the molecular mass and an experimental fragmentation spectrum for the peptide; (b) comparing the experimental fragmentation spectrum of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amino acid determination; molecular mass; fragmentation spectrum; DNA cloning; anti-body; recombinant; modification; mass spectrometry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide sequence determination used in e.g. DNA cloning - by comparing mass spectra of the unknown peptide with a library linear chain known peptide sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a process for preparation of short length peptides by culture of a transformant with an expression vector. Prepared by insertion of a gene encoding the fused peptide with the short peptide and the selective enzyme cleavage site, containing 2 or more genes encoding for a fused peptide with a short length peptide, particularly containing a histidine tag, and a selective enzyme followed by cleavage with the enzyme recognising the selective enzyme cleavage site. The method involves selective cleavage of jung cleavage site. The method involves selective cleavage of long cleavage to give the aimed short length peptide. The present sequence is a peptide derived from the ACE protein (not defined) suitable for production using the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amino acid determination; molecular mass; fragmentation spectrum; DNA cloning; anti-body; recombinant; modification; mass spectrometry.

The invention relates to a method for determination of the amino acid sequence of an unknown peptide. The method comprises (a) determining the molecular mass and an experimental fragmentation spectrum for the peptide: (b) comparing the experimental fragmentation spectrum of the unknown peptide with a theoretical fragmentation spectra calculated for a peptide library composed of all possible linear sequences of amino acids having a total mass that corresponds to the molecular mass of the unknown peptide; and (c) identifying a peptide in the library with a theoretical fragmentation spectrum that most closely matches the fragmentation spectrum of the unknown peptide. The method is useful in pink cloning, anti-body production, identification of recombinant products, and the study of post-translational modifications. It allows
            The C-terminal is amidated. The peptide is an example of a highly generic formula for bombesin antagonists which are [psi8-9 pseudo] tomospeptides control.

2.3.4.9-tetrahydro-iH-pyrido(13.4-b)-indo1-3-carboxylic acid (Tpi) at the N- and/or C-terminal (3.4-b)-indo1-3-carboxylic acid (Tpi) at the peptide is a bombesin/GRP (gastrin releasing peptide) antagonist and is useful for treatment of states of hypergastrinemia, e.g. pernicious anaemia, chronic atrophic gastriis, zollinger-Ellison syndrome and vitiligo, associated with diffuse hyperplasia of gastric enterochromaffin-like cells, and with an increased risk of developing multifocal gastric carcinoid tumours. The peptide can also be used to treat lung, colon and gastric cancers. Dosage is 1-1000 mircrog/Kg parenterally.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amino acid determination; molecular mass; fragmentation spectrum; DNA cloning; anti-body; recombinant; modification; mass spectrometry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide sequence determination used in e.g. DNA cloning - by comparing mass spectra of the unknown peptide with a library of linear chain known peptide sequences
                                                                                                                                                                                                                                                                                                54.8%; Score 23; DB 13; Length 8; 60.0%; Pred. unknown peptide with a theoretical fragmentation spectra calculated for a peptide library composed of all possible linear sequences of amino acids having a total mass that corresponds to the molecular mass of the unknown peptide; and (c) identifying a peptide in the library with a theoretical fragmentation spectrum that most closely matches the fragmentation spectrum of the unknown peptide. The method is useful in DNA cloning, anti-body production, identification of recombinant the sequence of unknown peptides or proteins with no sub-sequence identify, to be characterised using mass spectrometry. Sequences identify, to be characterised using mass spectrometry. Sequence of sexpality the method. The isoleucine residue in these peptides constructed to exemplity the method. The isoleucine residue in these peptides can be included in the library.

AAW60303-89 represent peptides recovered from human breast cancer. The peptides are tumour homing peptides, and are identified by in vivo panning. The in vivo panning comprises administering a library of diverse peptides to a subject having a tumour, collecting a sample of the tumour, identifying a peptide that fowes to the tumour, ollecting a sample of cormal tissue corresponding to the tumour, and determining that the peptide that homes to the tumour, and determining thissue. The tumour homing peptides can be linked to a moiety (e.g. doxorubicin), and used to direct the moiety to a tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tumour homing molecules and their conjugates – useful for, e g. directing linked molety to tumour containing anglogenic vasculature

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for determination of the amino acid sequence of an unknown peptide. The method comprises (a) determining the sequence of an unknown peptide. The method comprises (a) determining the sequence of an unknown peptide with a theoretical fragmentation spectrum for the unknown peptide with a theoretical fragmentation spectrum of the acids having a total mass that corresponds to the molecular mass of the unknown peptide, and (c) identifying a peptide in the library with a theoretical fragmentation spectrum that most closely matches the tragmentation spectrum in the library with a theoretical fragmentation spectrum identification of recombinant products, and the study of post-translational modifications. It allows products, and the study of post-translational modifications. It allows the sequence of unknown peptides or proteins with no sub-sequences identity, to be characterised using mass spectrometry. Sequences and with a peptide of the using mass spectrometry sequences identity the method. The isoleucine residue in these peptides constructed to exemplify the method. The isoleucine residue in these peptides can be replaced by leucine to construct another 264 linear peptides to be
                                                                                                                                                                                                                                                                                                                                                                                    ó
the sequence of unknown peptides or proteins with no sub-sequence identity, to be characterised using mass spectrometry. Sequences AAM87101 to AAM87104 represent a library of linear peptides constructed roexemplify the method. The isoleucine residue in these peptides can be replaced by leucine to construct another 264 linear peptides to be included in the library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amino acid determination; molecular mass; fragmentation spectrum; DNA cloning; anti-body; recombinant; modification; mass spectrometry.
                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide sequence determination used in e.g. DNA cloning - by comparing mass spectra of the unknown peptide with a library of Linear chain known peptide sequences

This invention describes novel peptides which home to angiogenic vasculature, specifically of a tumour and which have anti-tumour, anti-inflammatory, anti-angiogenic and anti-arthritic activity. Such anti-inflammatory, anti-angiogenic and anti-arthritic activity. Such molecules are identified by treating a purified MGR receptor with a test compound and identifying compounds that bind specifically to the NGR receptor. The peptides of the invention are inhibitors of angiogenesis and can be used to produce conjugates for delivering agents to angiogenic vasculature, particularly anticancer drugs or an imaging or an imaging or an imaging agent, for diagnosis or prognosis. These conjugates may be directed to non-tumour angiogenic vasculature, e.g. that present in inflammatory, regenerating or wounded tissue, e.g. for treatment of macular egenerating or wounded tissue, e.g. for treatment of macular provide specific targeting to tumours, especially their supporting vasculature. Precise targeting should reduce the systemic toxicity of anticancer drugs in the conjugates. Complete killing of all may result in an occlusive thrombus, and endothelial cells are unlikely to become resistant to anticancer agents nor to lose the targeting receptor. AskW938612-W93809 and AWW93843-44 are examples of tumour homing peptides used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0

US-09-731-242A-24

Sequence 24, Application US/09731242A

Sequence 24, Application US/09731242A

Patent No. US20020058253A1

GENERAL INFORMATION:

APPLICANT: WITTRUP, K. DANE

APPLICANT: HOLLER, PHILLIP

TITLE OF INVENTION: HIGH AFFINITY TCR PROTEINS AND METHODS

FILE REFERENCE: 89-99

CURRENT APPLICATION NUMBER: US/09/731,242A

CURRENT APPLICATION NUMBER: US 09/09,338

PRIOR PILING DATE: 1999-12-06

PRIOR PILING DATE: 1999-12-06

PRIOR PILING DATE: 1999-12-06

NUMBER OF SEQ ID NOS: 53

SOFTWARE: 1998-01-20

NUMBER OF SEQ ID NOS: 53

LEGTH: 7

LEGTH: 7
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30

OTHER INFORMATION:
OTHER INFORMATION: The sequence contains at position 1 an acetylated His, rat.
OTHER INFORMATION: than a His, and has an amide C-terminus (i.e., COOH).
